Introduction

Observations of the shark-directed bottom longline fishery in the Atlantic Ocean and Gulf of Mexico have been conducted since 1994 (e.g. Hale et al. 2012 and references therein). Currently about 217 U.S. fishers are permitted to target sharks (excluding dogfish) in the Atlantic Ocean and Gulf of Mexico, and an additional 263 fishers are permitted to land sharks incidentally. Amendments to the Consolidated Atlantic Highly Migratory Species Fishery Management Plan implemented a shark research fishery, which allows NMFS to select a limited number of commercial shark vessels on an annual basis to collect life history data and catch data for future stock assessments (NMFS, 2007). Specifically, only commercial shark fishers participating in the research fishery are allowed to land sandbar sharks, *Carcharhinus plumbeus*, and must carry an observer on 100% of all trips (compared to a target coverage level of 4-6% outside the research fishery). Outside the research fishery, fishers are permitted to land 36 non-sandbar large coastal sharks per trip (including blacktip shark, *Carcharhinus limbatus*, bull shark, *Carcharhinus leucas*, lemon shark, *Negaprion brevirostris*, nurse shark, *Ginglymostoma cirratum*, silky shark, *Carcharhinus falciformis*, spinner shark, *Carcharhinus brevipinna*, tiger shark, *Galeocerdo cuvier*, great hammerhead shark, *Sphyrna mokarran*, scalloped hammerhead shark, *Sphyrna lewini*, and smooth hammerhead shark, *Sphyrna zygaena*).

The commercial reef fish fishery is an important fishery in the Gulf of Mexico. It involves 819 permitted vessels that target groupers, snappers, and other reef fish species. There is also a subset of approximately 100 vessels that hold an eastern Gulf reef fish bottom longline endorsement, allowing them to use bottom longline gear deeper than 35 fathoms (64 meters) in the eastern Gulf of Mexico. Of these permitted vessels,

approximately 6% have both reef fish and directed shark permits. Thus, overlap occurs among longline vessels in both shark directed and reef fish fisheries, necessitating observer coverage in both fisheries.

Herein, we report on fishing activities in the bottom longline fishery for the 2012 fishing season, including coverage of the 2012 Shark Research Fishery.

Methods

In October 2011, NMFS announced its request for applications for the Shark Research Fishery from commercial shark fishers with a directed or incidental permit for 2011. Commercial shark fishers submitted applications to the Highly Migratory Species (HMS) Management Division. The HMS Management Division provided a list of qualified applicants to the Panama City Laboratory, and, based on the temporal and spatial needs of the research objectives, the availability of qualified applicants, and the available quota, five (5) qualified applicants were selected for observer coverage. These vessels carried observers on 100% of trips. Outside the research fishery and depending on the time of year and fishing season, vessels that targeted shark or reef fish, possessed current valid directed shark and reef fish permits, and reported fishing with longline gear in the previous year were randomly selected for coverage with a target coverage level of 2-3% for shark directed trips and 8% for reef fish directed trips. The eastern coastline of the USA was split into three fishing regions: North Atlantic, South Atlantic and Gulf of Mexico. References to the “North Atlantic” refer to the coastal waters off the eastern U.S. states from Maine to Virginia, the “South Atlantic” refers to the coastline from North Carolina to Florida, and the “Gulf of Mexico” refers to the coastline from the Florida

Keys to Texas (Richards, 1999). Vessels were selected from two fishing regions: South Atlantic and Gulf of Mexico.

Selection letters requiring observer coverage were issued to the permit holder via U.S. Certified mail approximately one month prior to the upcoming fishing season. Once the permit holder receives the selection letter, he or she is required to make contact with the observer coordinator and indicate intent to fish during the upcoming fishing season. If the permit holder intended to fish, the observer coordinator deployed an observer to the port of departure. Vessels were required to pass a Coast Guard Vessel Safety Examination as well as a safety evaluation by the observer prior to departure.

While onboard the vessel, the observer completes three data forms: Longline Gear Log, Longline Haul Log, and Animal Log. The Longline Gear Log is used to record gear characteristics. The Longline Haul Log is used to record the information on set and haulback, as well as environmental information. The Animal Log records all species caught, condition of the catch (e.g. alive, dead, damaged, or unknown), and the final disposition of the catch (e.g. kept, released alive, discarded dead, etc.).

In 2012, HMS Management Division changed the regulations for Shark Research Fishery trips to minimize unnecessary discard of dead sharks. Participants were allowed to harvest all non-prohibited species of sharks, including sandbar sharks only when an authorized sampler was onboard and the fishery was open. Fishers were required to land all catch of shark species that were legal under a directed shark permit (including sandbar shark, which is otherwise prohibited) unless they could be released alive. The amount of catch was limited with gear restrictions and the fishery opened with one set of 150 hooks per trip. This was a reduction from the average number of hooks used in 2011 (230

hooks; Hale et al. 2012). To reduce unwanted catch of prohibited dusky shark, the set allowance was revised to two sets per research trip in May: one 75 hook ‘feeler’ set with a soak time of no more than two hours and one 150 hook set with no soak limit. The number of hooks permitted on board was also increased to account for any lost hooks during a feeler set and provide fishermen flexibility to use different types of hooks while fishing for non-HMS species. In September, there was a further revision and the hook limits were doubled for each set. Observers continued to randomly sample sharks for biological materials for updates to life history studies. Vertebrae were collected from sandbar shark, blacktip shark and other select species to maintain time series of age distribution within the fishery. Observers also obtained trip weighout forms which were compared to shark dealer reports by quota monitoring managers to manage the sandbar shark quota within the research fishery.

Results

From January to December 2012, a total of 110 trips (defined as from the time a vessel leaves the port until the vessel returns to port and lands catch, including multiple hauls therein) on 35 vessels with a total of 730 bottom longline hauls (defined as setting gear, soaking gear for some duration of time, and retrieving gear) were observed (Table 1). Gear characteristics of trips varied by area (Gulf of Mexico or South Atlantic) and target species (grouper/snapper (reef fish), tilefish, non-sandbar large coastal shark, or sandbar shark). The universe of vessels in the Shark Research Fishery was less than three vessels in each area, so the observed data were combined for the Gulf of Mexico and South Atlantic Ocean to protect confidentiality of vessels. The data were grouped by targets into six groups: a) hauls targeting shallow water reef fish in the Gulf of Mexico

(81% of reef fish targeted sets were shallower than 50 fathoms (<91.4 m) depth), b) hauls targeting deep water reef fish in the Gulf of Mexico (19% of reef fish targeted sets were deeper than 50 fathoms (>91.4 m) depth), c) hauls targeting tilefish in the Gulf of Mexico, d) non-sandbar large coastal shark species in the Gulf of Mexico, e) non-sandbar large coastal shark species in the South Atlantic, and f) hauls targeting sandbar shark in the Gulf of Mexico and South Atlantic (Figure 1). No trips were observed in the North Atlantic region.

a) Gulf of Mexico shallow water reef fish targeted trips

i) Gear and haul characteristics

There were 427 hauls on 17 trips observed targeting reef fish (mainly red grouper, *Epinephelus morio*) in the Gulf of Mexico. Trips averaged 11.6 sea days in length. The mainline length ranged from 1.5 to 13.9 km with an average of 7.7 km. The bottom depth fished ranged from 29 to 91 m (depth ranges > 91.4 m were defined at deep water grouper target sets) with an average of 58 m, and the number of hooks ranged from 120 to 750 hooks with an average of 649 hooks fished. Circle hooks sized 13.0 were used 53.4% of the time, while circle hooks sized 14.0 were used 24.8% of the time. There were 158 hauls (37.0%) that employed two different types of hooks, with 14.0 circle hooks used most commonly as the second hook (57.6%). The average soak duration (the time from when the last hook entered the water until the first hook was hauled back) was 0.9 hr.

ii) Catch and bycatch

There were 34,092 individual animals caught on observed bottom longline hauls targeting reef fish in the Gulf of Mexico (Table 2). Teleosts comprised 96.4% of the

catch, followed by sharks (3.4%), invertebrates (0.1%), and batoids (0.1%). Red grouper was the most frequently caught species of teleost (80.6%), and Atlantic sharpnose shark, *Rhizoprionodon terraenovae*, was the most frequently caught species of shark (1.5%). Small coastal shark species comprised 59.8% of the shark catch, large coastal shark species (excluding sandbar shark) comprised 19.8%, deep water sharks comprised 5.3%, and sandbar shark represented 10.9%. No prohibited species were observed caught, but 4.3% of shark catch could not be identified to species. Length frequencies of shark species are presented in Figure 2.

iii) Protected species interactions

Three (3) loggerhead sea turtles, *Caretta caretta*, were observed caught in bottom longline gear targeting shallow water reef fish in the Gulf of Mexico (Table 2). No sawfish, bird, sturgeon or marine mammal interactions were observed.

b) Gulf of Mexico deep water reef fish targeted trips

i) Gear and haul characteristics

There were 100 hauls on 9 trips observed targeting deepwater reef fish (mainly yellowedge grouper, *Epinephelus flavolimbatus*) in the Gulf of Mexico. Trips averaged 12.1 sea days in length. The mainline length ranged from 1.9 to 12.6 km with an average of 7.7 km. The bottom depth fished ranged from 92 to 297 m with an average of 192 m, and the number of hooks ranged from 82 to 750 hooks with an average of 580 hooks fished. Circle hooks sized 13.0 were used 57.0% of the time, while circle hooks sized 15.0 were used 34.0% of the time. There were 48 hauls (48.0%) that employed two different types of hooks, with 16.0 circle hooks used most commonly as the second hook

(62.5%). The average soak duration (the time from when the last hook entered the water until the first hook was hauled back) was 1.9 hr.

ii) Catch and bycatch

There were 5,037 individual animals caught on observed bottom longline hauls targeting deepwater reef fish in the Gulf of Mexico (Table 3). Teleosts comprised 84.3% of the catch, followed by sharks (15.3%), invertebrates (0.4%), and batoids (0.02%). Blueline tilefish, *Caulolatilus microps*, was the most frequently caught species of teleost (28.9%), and smooth dogfish shark, *Mustelus canis*, was the most frequently caught species of shark (6.4%). Deep water sharks comprised 78.9%, small coastal shark species comprised 11.3% of the shark catch, and large coastal shark species (excluding sandbar shark) comprised 0.04%. The sandbar shark represented 1.0% and the prohibited species, night shark, *Carcharhinus signatus*, sevengill shark, *Heptranchias perlo*, sixgill shark, *Hexanchus griseus*, and bigeye sixgill shark, *Hexanchus vitulus*, made up 0.03% of the shark catch. Length frequencies of shark species are presented in Figure 3.

iii) Protected species interactions

No protected species were observed caught in bottom longline gear targeting deepwater reef fish in the Gulf of Mexico.

c) Gulf of Mexico tilefish targeted trips

i) Gear and haul characteristics

There were 33 hauls on 3 trips observed targeting golden tilefish, *Lopholatilus chamaeleonticeps*, in the Gulf of Mexico. Trips averaged 13.3 sea days in length. The mainline length ranged from 2.6 to 14.6 km with an average of 6.1 km. The bottom

depth fished ranged from 311 to 442 m with an average of 360 m, and the number of hooks ranged from 161 to 798 hooks with an average of 308 hooks fished. Circle hooks sized 15.0 were used 54.6% of the time, while circle hooks sized 13.0 were used 45.4% of the time. There were 19 hauls (57.6%) that employed two different types of hooks, with 16.0 circle hooks used most commonly as the second hook (94.7%). The average soak duration (the time from when the last hook entered the water until the first hook was hauled back) was 2.7 hr.

ii) Catch and bycatch

There were 2,466 individual animals caught on observed bottom longline hauls targeting tilefish in the Gulf of Mexico (Table 4). Teleosts comprised 94.1% of the catch, followed by sharks (5.8%), and invertebrates (0.04%). Golden tilefish was the most frequently caught species of teleost (81.8%), and Cuban dogfish shark, *Squalus cubensis*, was the most frequently caught species of shark (4.4%). Deep water sharks comprised 98.6% of the shark catch. One (1) bigeye thresher shark, *Alopias superciliosus*, and one (1) shortfin mako shark, *Isurus oxyrinchus*, was observed. Length frequencies of shark species are presented in Figure 4.

iii) Protected species interactions

No protected species were observed caught in bottom longline gear targeting tilefish in the Gulf of Mexico.

d) Gulf of Mexico large coastal shark targeted trips (non-research shark fishery)

i) Gear and haul characteristics

There were 68 hauls on 21 trips observed targeting large coastal shark in the Gulf of Mexico. Trips averaged 1.7 sea days in length. The mainline length ranged from 0.4 to 23.7 km with an average of 2.5 km. The bottom depth fished ranged from 5.0 to 70.0 m with an average of 16.1 m, and the number of hooks ranged from 35 to 713 hooks with an average of 98 hooks fished. The most commonly used hook was the 14.0 J hook (58.8%). There were no hauls (76.9%) that employed more than one type of hook. The second most commonly used hook was the 16.0 circle hook. The average soak duration was 11.7 hr.

ii) Catch and bycatch

There were 865 individual animals caught on observed bottom longline hauls targeting large coastal shark in the Gulf of Mexico (Table 5). Sharks comprised 97.6% of the catch, followed by teleosts (1.9%), and batoids (0.5%). Large coastal shark species (excluding sandbar shark) comprised 88.3% of the shark catch, small coastal shark species comprised 7.8%, sandbar sharks comprised 2.7%, and other prohibited sharks comprised 0.9% of the shark catch. Red drum, *Scianops ocellatus*, was the most frequently caught species of teleost (1.0%) and blacktip shark was the most frequently caught species of shark (59.4%). Length frequencies of shark species are presented in Figure 5.

iii) Protected species interactions

No protected species were observed caught in bottom longline gear targeting large coastal shark in the Gulf of Mexico.

e) South Atlantic large coastal shark targeted trips (non-research shark fishery)

i) Gear and haul characteristics

There were 21 hauls on 15 trips observed targeting large coastal shark in the South Atlantic. Trips averaged 2.0 sea days in length. The mainline length ranged from 2.0 to 13.0 km with an average of 5.8 km. The bottom depth fished ranged from 3.0 to 30.0 m with an average of 15.1 m, and the number of hooks ranged from 70 to 411 hooks with an average of 233 hooks fished. The most commonly used hook was the 18.0 circle hook (57.1%). There were six hauls (28.5%) that employed either another 18.0 circle hook or a 16.0 circle hook as the second hook. The average soak duration was 8.1 hr.

ii) Catch and bycatch

There were 1,212 individual animals caught on observed bottom longline hauls targeting large coastal shark in the South Atlantic (Table 6). Sharks comprised 94.4% of the catch, followed by batoids (3.4%), and teleosts (2.0%). Small coastal shark species comprised 47.8%, large coastal shark species (excluding sandbar shark) comprised 39.4% of the shark catch, sandbar sharks comprised 7.0%, smooth dogfish comprised of 5.2%, and other prohibited sharks comprised 0.2% of the shark catch. Red drum was the most frequently caught species of teleost (0.9%) and Atlantic sharpnose shark was the most frequently caught species of shark (36.6%). Length frequencies of shark species are presented in Figure 6.

iii) Protected species interactions

No protected species were observed caught in bottom longline gear targeting large coastal shark in the South Atlantic.

f) Gulf of Mexico and South Atlantic Shark Research Fishery
i) Gear and haul characteristics

There were 81 hauls on 53 trips observed in the Shark Research Fishery in the Gulf of Mexico and the South Atlantic. All of the trips targeted sandbar shark. Trips averaged 2.1 sea days in length. The mainline length ranged from 3.5 to 20.4 km with an average of 7.8 km. The bottom depth fished ranged from 9 to 212 m with an average of 38.6 m, and the number of hooks ranged from 39 to 300 hooks with an average of 156 hooks fished. The most commonly used hook was the 18.0 circle hook (60.5%) with 12.0 J hooks used in 16.1% of hauls. There were 25 hauls (30.9%) that employed two different types of hooks, with 12.0 J hooks used most commonly as the second hook. The average soak duration was 9.2 hr.

ii) Catch and bycatch

There were 3,057 individual animals caught on observed bottom longline hauls targeting sandbar shark in the Gulf of Mexico and South Atlantic (Table 7). Sharks comprised 97.9% of the catch, followed by teleosts (1.6%) and batoids (0.2%). Large coastal shark species (excluding sandbar) comprised 29.4% of the shark catch, sandbar shark comprised 48.6%, small coastal shark species comprised 11.8%, and deep water sharks comprised 0.1%. Prohibited shark species were also caught including the dusky shark (8.7% of shark catch), the sand tiger shark, *Carcharhias taurus* (1.0%), and the great white shark, *Carcharodon carcharias* (0.1%). Red grouper was the most frequently caught species of teleost (0.8%) and sandbar shark was the most frequently caught species of shark (47.6%). Length frequencies of shark species are presented in Figure 7.

iii) Protected species interactions

Interactions with protected resources were observed for bottom longline vessels fishing in the Gulf of Mexico and South Atlantic (Table 7). One (1) smalltooth sawfish, *Pristis pectinata*, and two (2) loggerhead sea turtles were observed. No sea bird or marine mammal interactions were observed.

Discussion

In 2012, the shark bottom longline observer program covered vessels in the Gulf of Mexico and South Atlantic, with the majority of trips observed targeting sandbar shark in the Shark Research Fishery. Catch data and biological samples collected through the Shark Research Fishery continues to provide much needed life history information for stock assessment. For example, catch and bycatch information was recently incorporated into the Southeast Data Assessment and Review (Carlson and Gulak, 2013; Carlson et al., 2013). The Southeast Reef Fish Catch Shares Project also allowed for increased observer coverage in the bottom longline fishery and permitted the collection of otoliths and gonads for future reef fish stock assessments. Data have been incorporated into the Southeast Data Assessment and Review (Gulak and Carlson, 2013a; 2013b) for gag grouper and greater amberjack.

Several changes were made to the Shark Research Fishery in 2012. The 2012 Shark Research Fishery was designed to help fishermen effectively target sandbar sharks while minimizing bycatch of other sharks, specifically prohibited species. Fishers were required to land all catch of shark species that were legal under a directed shark permit (including sandbar shark, which is otherwise prohibited) unless they could be released

alive. This change to the Shark Research Fishery did result in an overall reduction in discards (22.9% in 2012 from 30.6% in the previous year). Despite these changes, fishermen were catching large amounts of prohibited species, specifically dusky sharks (163 individuals in March) and not catching sharks at the expected rate, hindering data collection for ongoing research. As a result, the 2012 research fishery permits were amended to allow fishermen to conduct an optional “feeler” set to test for available species in order to effectively target sandbar sharks while minimizing bycatch of other sharks, specifically dusky sharks. This resulted in a reduced encounter rate of all dusky shark interactions from the previous incidents in March.

Continued observer funding will permit the Shark Research Fishery to continue to provide data on temporal and spatial catch, release mortality, and bycatch species. These data have proven essential to stock assessments and to provide updates to quota monitoring.

Figure 1. Distribution of all observed hauls by target in 2012. (a) Frequency of sets targeting shallow water reef fish in the Gulf of Mexico, (b) frequency of sets targeting deep water reef fish in the Gulf of Mexico.

(a)

(b)

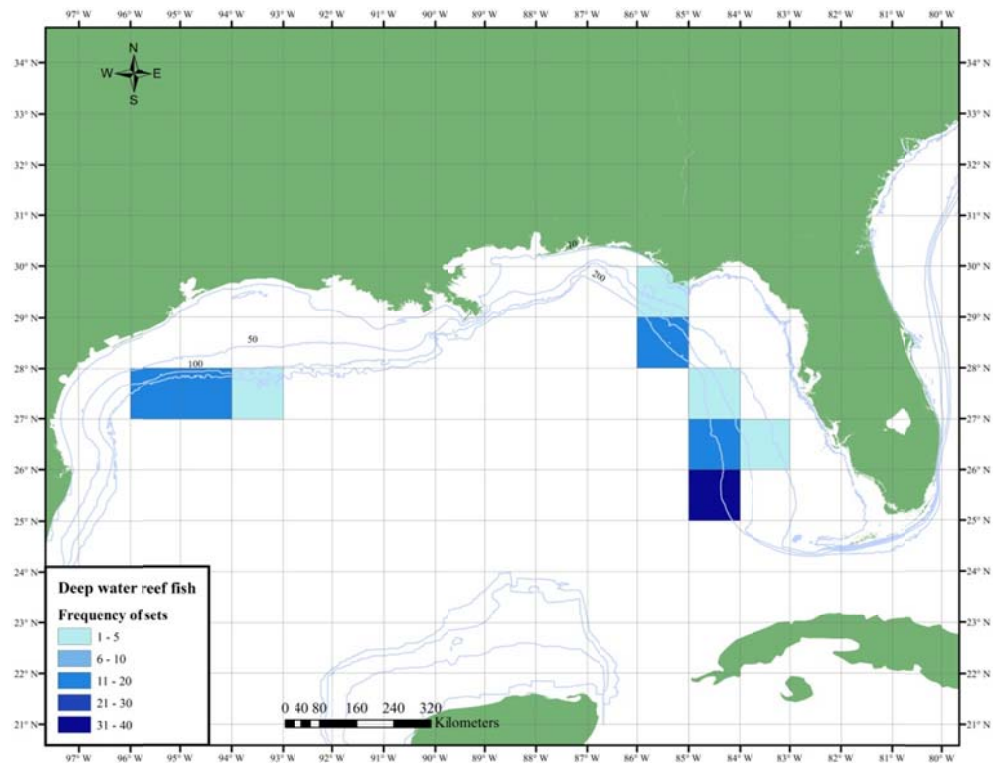

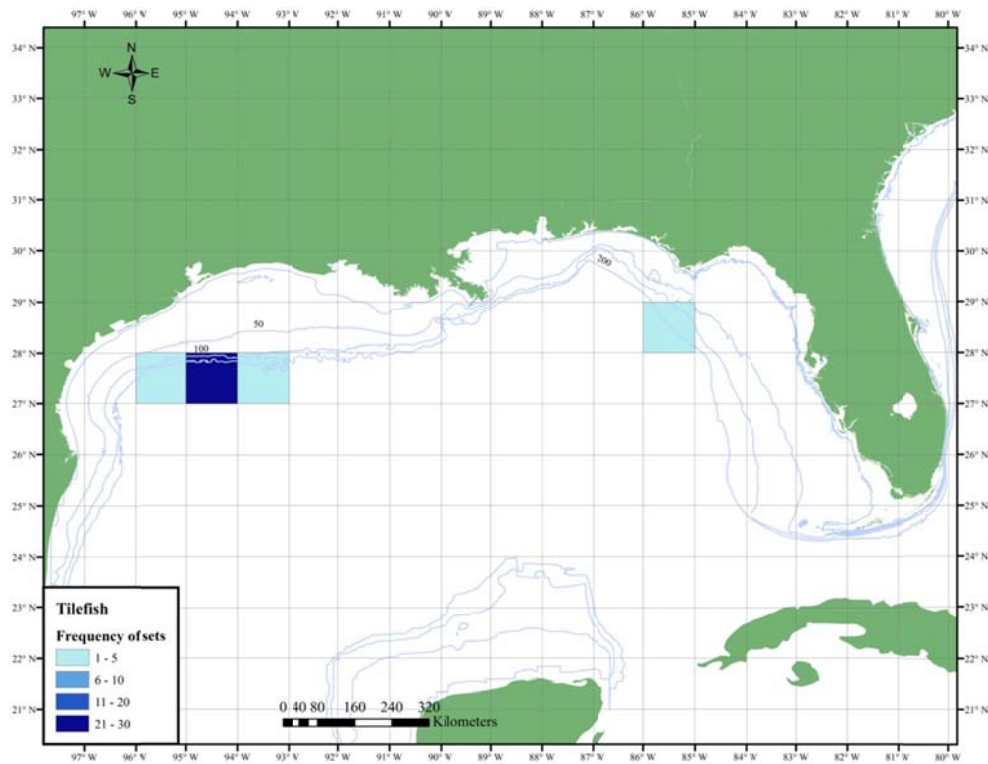

Figure 1 cont'd. Distribution of all observed hauls by target in 2012. (c) Distribution of effort targeting tilefish in the Gulf of Mexico, (d) distribution of effort targeting large coastal sharks in the Gulf of Mexico.

(b)

(c)

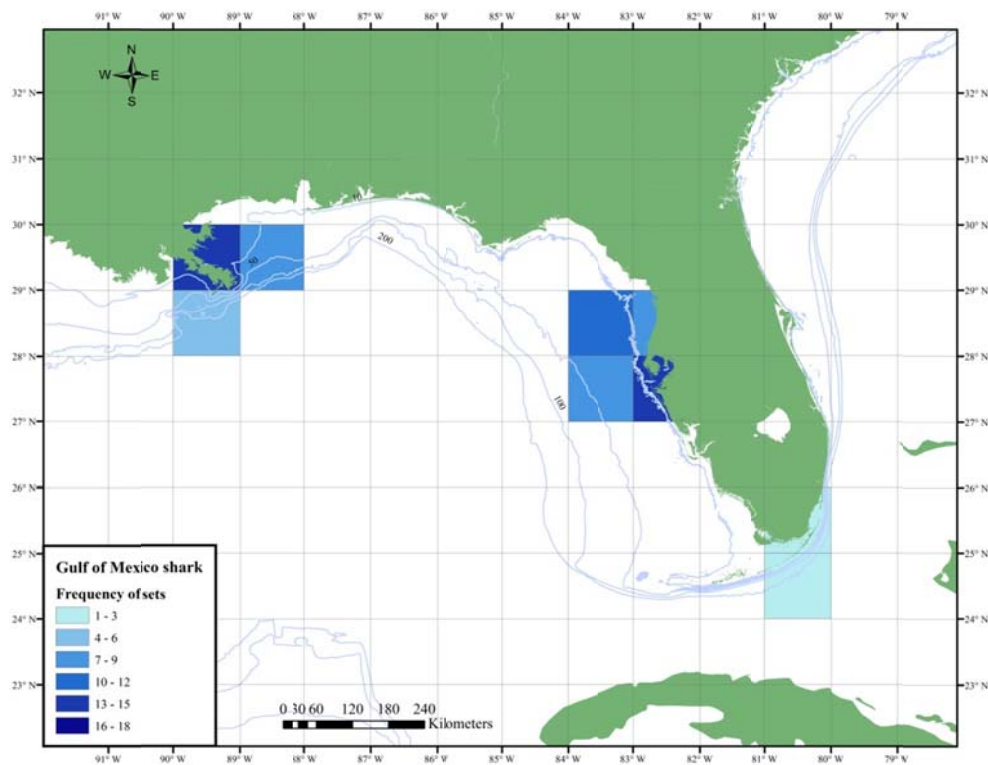

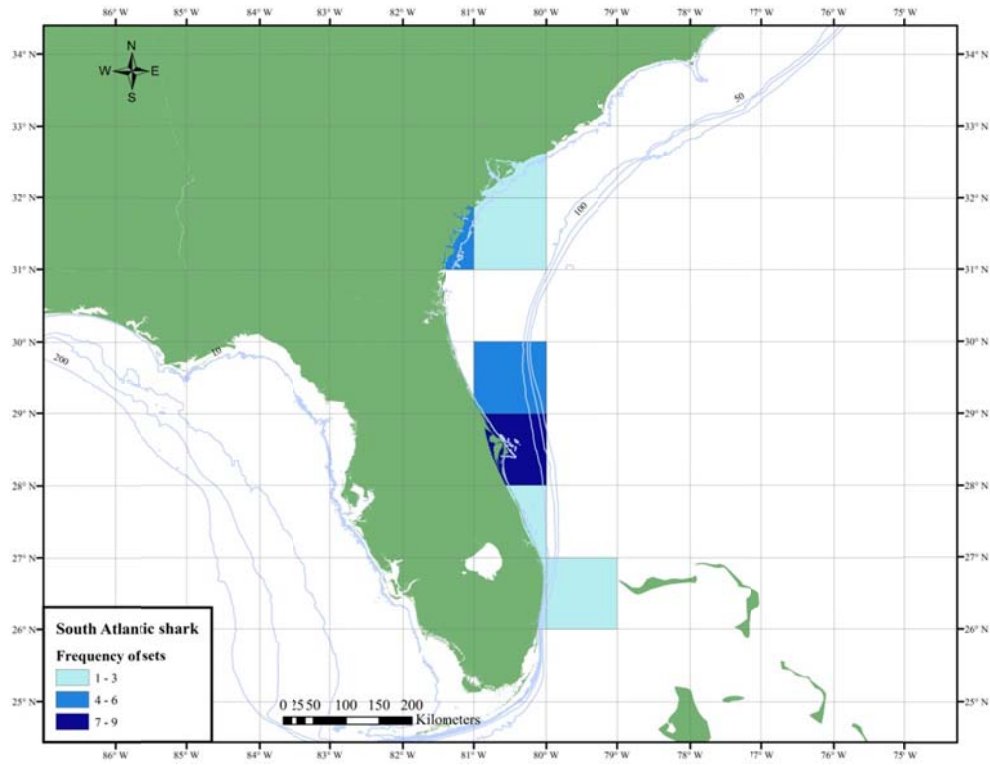

Figure 1 cont'd. Distribution of all observed hauls by target in 2012. (e) Distribution of effort targeting large coastal sharks in the South Atlantic, (f) distribution of effort targeting sandbar sharks in the Gulf of Mexico and South Atlantic.

(e)

(f)

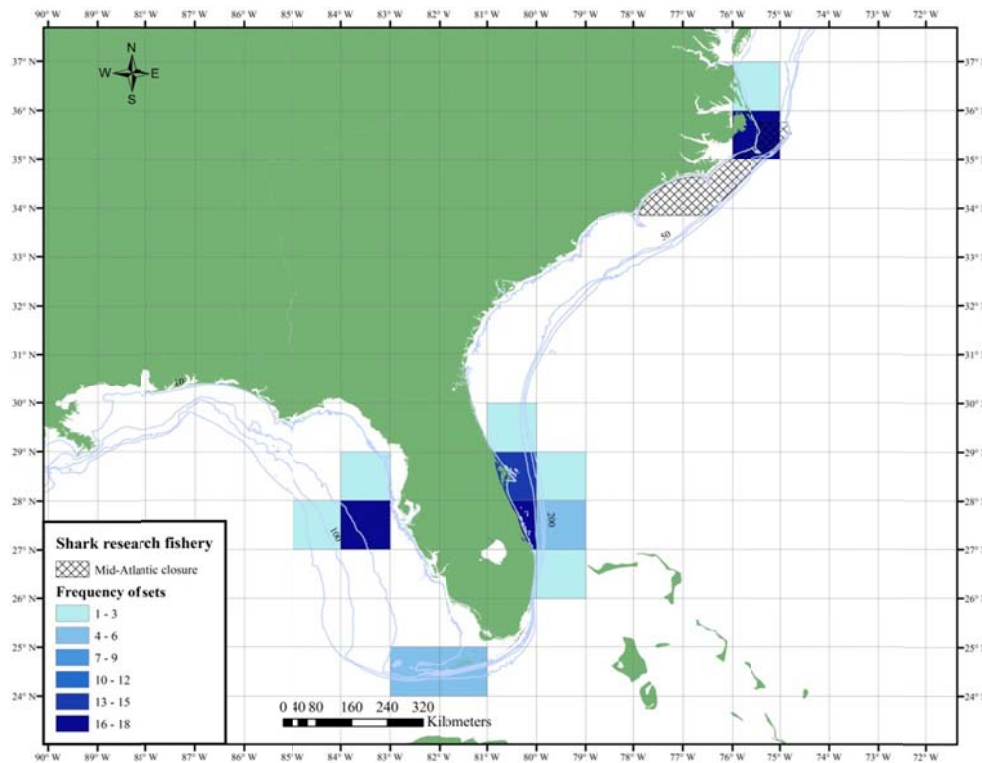

Figure 2. Length frequency (cm fork length) of (a) silky (FAL), nurse (NUR), blacktip (SBK), spinner (SSP) and tiger (TIG) sharks, (b) small coastal sharks including Atlantic sharpnose (SAS), blacknose (SBN) and bonnethead (BHH) sharks observed caught on bottom longline sets targeting shallow water reef fish in the Gulf of Mexico.

(a)

(b)

Figure 2 cont'd. Length frequency (cm fork length) of (c) smooth dogfish (DGS) and sandbar (SSB) sharks observed caught on bottom longline sets targeting shallow water reef fish in the Gulf of Mexico.

(c)

Figure 3. Length frequency (cm fork length) of (a) silky (FAL), blacktip (SBK), scalloped hammerhead (SPL) and tiger (TIG) sharks observed caught on bottom longline sets targeting deep water reef fish in the Gulf of Mexico.

(a)

Figure 3 cont'd. Length frequency (cm fork length) of (b) small coastal sharks including Atlantic sharpnose (SAS) and blacknose (SBN) sharks, (c) deep water sharks including cuban dogfish (DCU), chain catshark (DGC) and smooth dogfish (DGS) sharks, observed caught on bottom longline sets targeting deep water reef fish in the Gulf of Mexico.

(b)

(c)

Figure 3 cont'd. Length frequency (cm fork length) of (b) prohibited sharks including bigeye sixgill (BSX), sixgill (SIX), night (SNI) and sandbar (SSB) sharks observed caught on bottom longline sets targeting deep water reef fish in the Gulf of Mexico.

Figure 4. Length frequency (cm fork length) of deep water sharks including Cuban dogfish (DCU), chain catshark (DGC), shortspine dogfish (DGM) and roughskin dogfish (DGR) sharks observed caught on bottom longline sets targeting tilefish in the Gulf of Mexico.

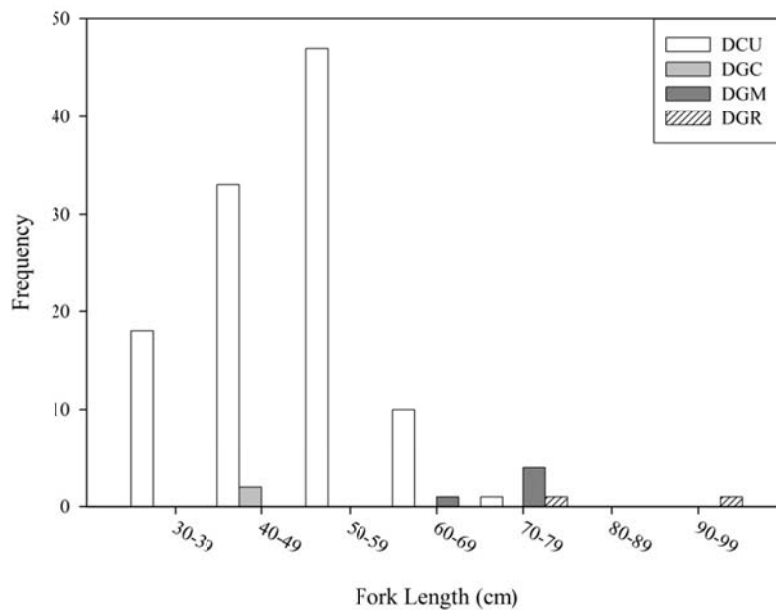

Figure 5. Length frequency (cm fork length) of (a) silky (FAL), bull (SBU), spinner (SSP) and sandbar (SSB) sharks, (b) great hammerhead (GHH), lemon (LEM), scalloped hammerhead (SPL) and tiger (TIG) sharks observed caught on bottom longline sets targeting large coastal shark in the Gulf of Mexico.

(a)

(b)

Figure 5 cont'd. Length frequency (cm fork length) of (c) blacktip (SBK) sharks, (d) small coastal sharks including Atlantic sharpnose (SAS), blacknose (SBN) and finetooth (SFT) sharks observed caught on bottom longline sets targeting large coastal shark in the Gulf of Mexico.

(c)

(d)

Figure 6. Length frequency (cm fork length) of (a) lemon (LEM), bull (SBU), spinner (SSP) and tiger (TIG) sharks, (b) blacktip (SBK) sharks observed caught on bottom longline sets targeting large coastal shark in the South Atlantic.

(a)

(b)

Figure 6 cont'd. Length frequency (cm fork length) of (c) small coastal sharks including Atlantic sharpnose (SAS), blacknose (SBN) and finetooth (SFT) sharks, (d) smooth dogfish (DGS) sharks observed caught on bottom longline sets targeting large coastal shark in the South Atlantic.

(c)

(d)

Figure 6 cont'd. Length frequency (cm fork length) of (e) prohibited sharks including Caribbean reef (SRF) and sandbar (SSB) sharks observed caught on bottom longline sets targeting large coastal shark in the South Atlantic.

(e)

Figure 7. Length frequency (cm fork length) of (a) sandbar (SSB) sharks observed caught on bottom longline sets targeting sandbar shark in the Gulf of Mexico and South Atlantic.

(a)

Figure 7 cont'd. Length frequency (cm fork length) of (b) silky (FAL), blacktip (SBK) bull (SBU) and spinner (SSP) sharks, (c) great hammerhead (GHH), lemon (LEM), scalloped hammerhead (SPL) and tiger (TIG) sharks observed caught on bottom longline sets targeting sandbar shark in the Gulf of Mexico and South Atlantic.

(b)

(c)

Figure 7 cont'd. Length frequency (cm fork length) of (d) small coastal sharks including Atlantic sharpnose (SAS) and blacknose (SBN) sharks, (e) prohibited sharks including dusky (DUS), white (GWS) and night (SNI) sharks observed caught on bottom longline sets targeting sandbar shark in the Gulf of Mexico and South Atlantic.
